

PHP Function Practice Exercise

1. **Implement a void function that prints "Hi from void function".**

Hint: A void function doesn't return any value but simply performs an action like printing to the screen.

2. **Implement a void function that accepts a first name and last name and prints the full name.**

Hint: The function should accept two parameters and print the full name in the format "First Name Last Name".

3. **Implement a function that accepts a rest parameter and prints all the numbers passed as arguments.**

Hint: Use the rest parameter syntax to accept any number of arguments and print them.

4. **Implement a function with a default parameter for a greeting message. The default message should be "Hello, Guest!" if no argument is passed.**

Hint: Provide a default value for the parameter in case no argument is given when calling the function.

5. **Implement a function that accepts named parameters for `name`, `age`, and `city`, and prints a sentence like:**

Samy is 25 years old and lives in Beirut.

Hint: Use named parameters to pass values in any order.

6. **Implement a function that returns the multiplication of two numbers.**

Hint: The function should take two numbers as parameters and return their multiplication.

7. **Implement a function called printOddNumber, if the number is even stop the function printing odd number**

Hint: Void functions are not supposed to return values. Use return (without returning values) to do this task
