

PHP Assignment: Sending Data with POST

Objective

Your task is to create a PHP script that can receive data via a POST request and return a JSON response with a 201 HTTP status code.

Requirements

- Send data using the **POST** method inside the `body` of the request.
- Data should include at least `name` and `age` fields.
- The server must respond with a JSON object confirming the received data.
- The HTTP status code returned must be 201 (Created).
- If a method other than POST is used, the server should return an appropriate error.

Tip: Use `php://input` to read JSON data from the POST body and `http_response_code(201)` to set the status code.

Example

Request body (JSON):

```
{ "name": "Alice", "age": 25 }
```

Response (HTTP 201):

```
{ "status": "success", "message": "Data received", "data": { "name": "Alice", "age": 25 } }
```

Submission

- Submit your PHP script file only.
- Make sure it can be tested using `POST` requests with JSON data.
- Include any instructions for testing if necessary.
